Production Program

RAS Reinhardt Maschinenbau GmbH

www.RAS-online.de
**Folding**

Frequently changing parts and small batch sizes require a universal bending technology. The most common bending techniques are press brake bending and folding. On a press brake the punch moves into the die. The blank located between the tools will be bent. On a folding machine the sheet is placed on a table. A gauging system positions the part to the bend line. The upper beam and lower beam clamp the material. During the bending cycle the folding beam moves up around a pivot point. For machines equipped with bi-directional bending, the folding beam can either move up or down depending on the bending direction.

**Handling**

The long flange of the part remains on the support table. As a result, folding is significantly faster, particularly for large parts. Additional bending supports are not needed. At the same time, folding is also safer as the operator is not in touch with the part during clamping and bending.

Even large workpieces can be handled by one person. Folding therefore is a very cost efficient bending method. If the bending direction changes on a large panel, folding machines are available that can bend in both directions (up/down).

The long flange of the part remains on the support table - the short flanges are bent.

**Number of tools / Tool changes**

Folding machines can bend any angle with a single tool. The machine automatically adjusts to the sheet thickness. The universal tools reduce the setup times as well as the investment and operating costs. Advanced automated folding machines come with an automatic tool changer.

**Sensitive material surfaces**

Folding reduces the sliding of tools against material surfaces to a minimum, or completely eliminates it on some machines (Multibend-Center, ProfileCenter). You will find no scratches on the material surface - ideal for stainless steel or coated sheets.

**Bending radii**

A radius can easily be created using a folder with small bending steps. By using small steps the outside of the radius will be very smooth and the individual steps will not be visible.

**Tool wear**

As there are only very slight relative movements between the tool and the material surface, the tooling shows no abrasion wear even after years of use.

**Bending hems**

Folding does not require special tools for hemming. Open or closed hems can be created.
Influence of sheet thickness tolerances
With folding technology, the folding beam tools touch the outside of the material and move exactly to the programmed angle. This angle reference is only on the outside of the material. As a result, sheet thickness tolerances do not affect the bend angle or the repeatability.

Influence of the gauging method
On a folding machine the entire part is inside the machine. Only a short flange stands out of the upper and lower beam tool. A folder gauges the part instead of the flange. Blanks tolerances disappear in the first flange. The area dimension and the opposite flanges are always accurate.

Symbols
- Machine bends up.
- Machine bends up and down (UpDown technology).
- The machine bends open ended profiles.
- The machine bends profiles and boxes/panels.
- The software programs the part automatically and recommends the best bending strategy with a 5-star ranking. The bending process is shown in a 3D simulation. Bending 4.0 realized!
- The software allows the programming of the part assisted by a 3D simulation.
- The machine has an automatic tool changer.

Swing beam shears are machine tools that perform straight cuts on sheet metal. On a swing beam shear the upper blade moves in a circular arc. The rigid design of the shear and the extremely low rake angle ensure that blanks as small as 10 to 15 x material thickness remain flat after cutting.

The upper blade penetrates the metal sheet above the lower blade and supplies clean, right-angled cuts with almost no burr.

The cutting gap can be easily adjusted by simply turning the cutting gap eccentric.

Our innovative swing beam cutting technology guarantees clean, straight, dimensionally accurate and right-angled cuts.

Bending Centers

Multibend-Center

Office software with one-click programming starting from a STEP, DXF, GEO file of the part. No expert knowledge required. Fast, safe, precise.

The best bending sequences are shown according to the highest the 5-star ranking.

The 3D simulation shows the folding sequence and possible collisions. New products can already be evaluated during the design process.

The Multibend-Center is characterized by speed and high productivity levels.

Fully automatic bending sequences: positioning, rotation, bending, and tool change.

Scratch-free bending of sensitive materials. No tool wear.

Four-sided boxes can be as tall as 203 mm.

Due to highest levels of precision and repeatability, the parts are suitable for laser welding.
In addition to manual loading and unloading, there are a variety of options for automatic loading and unloading of the machine. Depending on the requested degree of automation and the manufacturing conditions, the handling systems on the loading and unloading side can be individually configured.

### Loading and unloading

**Multibend-Center with MiniFeeder loading component.** Blanks are supplied on a scissor table.

**Suction frame of the gantry loader with 6 suction cups used to peel up the blank and 45 freely moveable suction cups.**

**Touchless double sheet detection arm on the suction frame after lifting of the blank.**

**Multibend-Center with single or double station gantry loader.**

**Multibend-Center with manual part unloading via finished part buffer or automatically by intelligent robot. Rotation station for finished parts. Provision of the pallets by U-shaped pallet station.**

**Multibend-Center with manual part unloading via finished part buffer or automatically by intelligent robot. Rotation station for finished parts. A pallet magazine provides pallets. Back panel magazine provides back panels for vertical stacking, the robot attaches them automatically to the pallet.**

**Multibend-Center with robot loading. Provision of the blanks on Euro-pallets. The robot can also flip the blanks. Intelligent robot: No programming or teaching required.**

**Multibend-Center with robot loading. Blanks supplied from a storage system. The robot can also flip the blanks. Intelligent robot: No programming or teaching required.**

- Automatic part positioning by a suction gauging system.
- High flexibility in handling due to front suction cups and small part suction cups.
- Upper beam tools for boxes up to 400 mm tall.
- The automatic tool changer places the tools of the upper beam in position.
- Maximum bending accuracy due to the patented beam-in-beam folding beam design.
- Extended flexibility, as the folding beam can be used as a gauging stop.
- Accurate alignment of long and narrow parts with the active squaring arm.
The best bending sequences are shown according to the highest the 5-star ranking.

The 3D simulation shows the folding sequence and possible collisions. New products can already be evaluated during the design process.

Maximum bending accuracy due to the patented beam-in-beam folding beam design.

Accurate alignment of long and narrow parts with the active squaring arm.

Rectangular and T-shape gauging system

The suction cups of the hybrid gauging system hold the part through a sequence of bends to the stop fingers.

If the outside edges of the blank are not straight, individual stop fingers can be deactivated.

Quick tool change: Place upper and folding beam tools according to setup instructions ... they will be clamped automatically.

Extended flexibility, as the folding beam can be used as a gauging stop.

Control monitor on gauging system side

Bending Centers

MiniBendCenter

Simple to use Office software starts from a STEP file of the part with 3D visualization of the bending processes.

Fully automatic up and down bending with a maximum sheet thickness of 3 mm.

The RAS MiniBendCenter is the world’s only folding center for small parts. The blanks are automatically loaded, aligned and squared. Tool setup is automatic.

Robotic loading offers maximum flexibility. Blanks can be loaded from a bulk material box or from stacks.

Measuring the parts by a laser scanner.

Several bending stations can be setup along the length of the machine. Complex parts can be completed in a single run.

Highest levels of precision and repeatability.

Dedicated unloading of the finished parts depending on floor space conditions, material flow, and sensitivity of the parts.

Unloading of finished parts into bulk material containers.

Automatic folding beam adjustment for thin and thick materials.

Stop finger at minimum stop dimension

Rear of the TURBObend with rectangular gauging system.
The sorting and sheet support system holds the blank flat before the cut. This eliminates the material from hanging down and guarantees for perfect cutting dimensions.

Extra long sheets can be cut while passing underneath the backgauge. The backgauge moves to its maximum dimension and the sheet support moves slightly downward.

After the cut is made, the sheet support system can tilt to three different angles. Even small strips of 40 mm can slide down quietly and gently.

The programmable small parts chute delivers cut pieces (max. 200 x 500 mm) into a container in front of the machine.

Return-back function: The CNC backstop can push a cut piece below the finger protection back to the operator. Less running around, more production time.

For trim cuts the sheet support moves backwards so that cut strips can fall into the spacious scrap container.

The sheet support system guides even thin materials exactly to the CNC backstop.

Front stops (available also with a precision scale) allow an accurate part positioning.

Small parts chute for sorting small blanks.

Spacious scrap container

Side free space for an easy blade change.

Duct Seaming Machines

DuctZipper V-shape

Air duct with a single seam joint

Air duct with two seam joints

Air duct

DuctZipper with SealJet for maximum tightness and energy efficiency.

Duct seam inserted with gel sealant for the highest tightness requirements.

Autopilot and reinforced seaming bar on the RAS 20.12 DuctZipper.

The DuctZipper in L-shape is specifically designed for large ducts. On the DuctZipper L, the working position is rotated by 45 degrees. The horizontal flange of the duct rests on the table while the vertical flange is directed straight up. Gripping grooves in the vertical wall let the operator easily hold and guide the duct while passing it through the machine.

Easily accessible forming rolls for maintenance work.

Improved seaming accuracy also results in a reduced distortion of the duct cross-section.

Operating speed doubled: After the first duct is finished and removed, the operator clamps the next duct with the AutoPilot and is ready to pass the next air duct through the machine.

Even very large ducts can be produced with only two operators.
